

PRODUCT INFO

Sensor mounts SSQ of die-cast aluminum have a slitted clamping point and a sensor bore, both machined by cutting methods.

The sensor bore allows attachment of a sensor with male thread. It is offset in the plane and situated at an angle of 90° to the clamping point bore, which receives typically available construction tubes with full contact over the entire cross-section.

At the screw point, a hex socket cap screw or an adjustable hand lever reduces the bore cross-section for clamping.

Adjustable hand levers are intended for repeated, tool-free clamping. Under the designation HSK, these are available separately for individual use and in other designs. Compared with the tool-operated hex socket cap screw, the clamping force achievable with an adjustable hand lever is lower due to the shorter lever length.

ACCESSORIES

- Adjustable hand levers **HSK** see page 168

ON REQUEST

- Clamping points with special diameter
- Screw point with hex head screws
- Surface ball-burnished, anodized or powder-coated in other RAL colors
